The report requires updating with new data and is sent in 48 hours after order is placed.

As an emerging ablation therapy, pulsed field ablation uses high-intensity electric fields to cause irreversible electrical injury to tissues, destroy cell membranes, and lead to high cell permeability and death, thereby achieving the effect of tissue ablation. This new type of pulsed electric field ablation technology can generate microsecond-level pulsed electric fields during the ablation process and create nanosecond-level micropores on the cell membrane to achieve "electroporation." Compared with smooth muscles and nerve cells, cardiomyocytes have the lowest threshold for pulsed electric fields, making them the first to undergo necrosis during pulsed electric field ablation. Pulsed field ablation has the advantages of tissue selectivity, non-thermal energy ablation, and fast electric field action, and has gradually developed worldwide.

The global Pulsed Field Ablation System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
