The global Pulsed Intense Light Sterilization Robot market size is predicted to grow from US$ 137 million in 2025 to US$ 222 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

The pulsed light disinfection robot is an intelligent device that uses high-intensity, short-duration pulsed light for contactless sterilization. It typically uses a xenon lamp as its light source, emitting a broad spectrum of intense light (200–1100 nm) covering the ultraviolet, visible, and near-infrared regions. Its sterilization mechanisms include photochemical destruction of microbial DNA, photothermal effects that cause cell structure collapse, and transient high-energy pulses that cause irreversible damage to microorganisms. The robot integrates features such as automatic navigation, human-machine separation, and intelligent control, making it suitable for rapid disinfection in high-standard environments such as hospitals, public spaces, and food factories. Compared to traditional ultraviolet or chemical disinfection methods, it offers advantages such as fast sterilization (5–15 minutes), no residue, and environmental safety, making it a new generation of efficient sterilization solutions.

In 2024, global production of pulsed light disinfection robots reached 1,586 units, with an average selling price of US$87,000 per unit. Gross profit margins are approximately 60%–70%. Companies like DONEAX and Zhongwu Optoelectronics have an annual production capacity of approximately 150–300 units per production line. The upstream industry chain for pulsed light disinfection robots relies on core raw materials such as xenon lamps, quartz glass, capacitors, and control chips, and incorporates technologies such as AI navigation, spectral control, and remote monitoring. Downstream, these robots are widely used in hospitals, food companies, public health systems, pharmaceutical factories, and government procurement and emergency epidemic

prevention systems. In the future, these devices will accelerate their development towards "intelligence + automation," enabling efficient, unattended disinfection. Integration with visual recognition systems will promote the integrated application of sterilization and detection, gradually replacing traditional UV and chemical disinfection methods and leading the advancement of green, safe, and efficient harmless disinfection technologies.
