The global Pump Wear Ring market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A pump wear ring is a component used in centrifugal pumps to reduce the wear and tear on the impeller and casing. It is typically made of a softer material than the impeller and casing, such as bronze or stainless steel, and is installed between the impeller and casing. The wear ring creates a small gap between the impeller and casing, allowing for smooth rotation of the impeller without direct contact with the casing. This helps to minimize friction and wear, prolonging the life of the pump and improving its efficiency.
