Pumped Electric Shower is a shower device that integrates an electric booster pump and an electric heating system. It increases the water pressure through an electric pump and instantly heats the water using electric heating elements (such as ceramic heating tubes, resistance wires, etc.), thereby providing a strong, constant-temperature shower experience in scenarios with insufficient water pressure. Its core function is to solve the problem of weak water flow caused by insufficient municipal water supply pressure (such as in old residential areas, high-rise residential buildings, etc.) in traditional showers. At the same time, it achieves instant heating through electric heating without relying on storage water heaters.

United States market for Pumped Electric Showers is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
