Purified nitrogen generator is a device specifically used to separate and extract high-purity nitrogen from the air. Purified nitrogen generators use specific technologies and methods to effectively separate oxygen and other impurities in the air to obtain high-purity nitrogen. This type of nitrogen generator mainly uses physical adsorption or membrane separation to separate nitrogen and oxygen in the air. Physical adsorption (such as PSA nitrogen generator) uses the different adsorption properties of molecular sieves to nitrogen and oxygen to separate nitrogen and oxygen under specific pressure and temperature conditions. Membrane separation uses special gas separation membranes to allow nitrogen to pass through first, while oxygen and other impurities are retained, thereby obtaining high-purity nitrogen.

The global Purified Nitrogen Generator market size is projected to grow from US\$ 391 million in 2024 to US\$ 514 million in 2030; it is expected to grow at a CAGR of 4.7% from 2024 to 2030.
