The global Purifying Horizontal Srew Centrifuge market size is predicted to grow from US$ 384 million in 2025 to US$ 495 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

The purification type horizontal screw centrifuge is a highly efficient centrifugal separation equipment. It adopts the method of horizontal spiral unloading and continuous operation, and uses the principle of centrifugal sedimentation to separate materials. The purification type is designed for specific purification needs, with higher separation efficiency and better purification effect. The working principle of the purification type horizontal screw centrifuge is based on the principle of centrifugal sedimentation. After the material is continuously introduced into the inner cylinder of the feeding spiral from the feed pipe, the material is thrown into the drum cavity under the centrifugal force generated by high-speed rotation. Since the density of the solid phase particles is greater than that of the liquid phase, they are thrown on the inner wall of the drum to form a solid layer (solid ring layer), while the liquid phase is located on the inside of the solid ring layer to form a liquid layer (liquid ring layer). Through the relative movement of the spiral and the drum, the sludge in the solid ring layer is slowly pushed to the conical end of the drum and discharged, while the liquid in the liquid ring layer overflows through the overflow hole at the large end of the drum, thereby achieving continuous separation.
