## Abstracts

The global Push-Pull Output Comparator market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The push-pull output comparator is a commonly used comparator circuit, and its output uses a push-pull output circuit. Different from the open-drain output comparator, the output terminal of the push-pull output comparator can output both high level and low level, so the output signal is more stable and the circuit noise is smaller. The basic working principle of a push-pull output comparator is similar to other comparators, it compares two voltage signals and converts the comparison result into an output signal. The push-pull output circuit consists of two transistors (NPN and PNP). When the output signal is high level, the PNP tube is turned on, and the NPN tube is turned off. The output terminal is connected to the positive power supply, and the output is high level; when the output signal is low level Normally, the PNP tube is off, the NPN tube is on, the output terminal is connected to the negative power supply, and the output is low. The output of the push-pull output comparator can drive various loads, such as LED, relay, motor, etc. The push-pull output comparator is widely used in industrial automation, power management, motor control, sensor signal processing and other fields.

United States market for Push-Pull Output Comparator is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Push-Pull Output Comparator is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
