Push-to-talk (PTT) over WiFi refers to a communication method that enables users to initiate voice transmissions by pressing a button, rather than continuously transmitting like in traditional phone calls. When using WiFi, PTT leverages a wireless network connection instead of cellular networks. It allows for instant communication over local or wide area networks, facilitating efficient group conversations and coordination, especially in environments where real-time communication is crucial, such as in emergency services, logistics, or team-based activities. This technology is often used in applications like voice messaging apps, walkie-talkie style devices, or specialized communication systems for businesses.

The global Push-To-Talk over WiFi market size is projected to grow from US\$ 3634 million in 2024 to US\$ 5189 million in 2030; it is expected to grow at a CAGR of 6.1% from 2024 to 2030.
