The global PV Duct-type Air Conditioner market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

PV duct-type air conditioners are a type of air conditioning system that uses solar power to drive the system.

PV duct-type air conditioners are systems that integrate solar panels to generate electricity for powering air conditioning units, offering energy-efficient and environmentally friendly cooling solutions. Growing concerns about energy consumption and environmental sustainability have increased the demand for energy-efficient air conditioning solutions. PV duct-type air conditioners offer an eco-friendly cooling option by harnessing solar energy. PV duct-type air conditioners are often integrated into the design of new green buildings and energy-efficient structures. They contribute to reduced reliance on grid electricity and lower carbon emissions. These air conditioners are particularly suitable for off-grid and remote locations where access to the electrical grid is limited. They provide cooling in areas without a stable power supply. The development of hybrid air conditioning systems that combine solar energy with grid power is a trend. These systems ensure uninterrupted cooling, even during cloudy or low-sunlight periods. Coupling PV duct-type air conditioners with energy storage solutions, such as batteries, enhances their reliability and allows for the use of solar-generated electricity during nighttime or overcast conditions. Ongoing advancements in photovoltaic technology and the design of air conditioning systems are improving the efficiency and performance of PV duct-type air conditioners. Emerging markets, including regions with high solar potential, are witnessing increased adoption of PV duct-type air conditioners as part of efforts to address cooling needs while reducing reliance

on conventional power sources.
