Electrical conduit is simply a tube that is used for electrical wires to pass through to provide protections to both the wire, and to any persons who might be close to that wire run. It can be found in many different applications, and also many different variations depending on the specific applications it is being used in.

PVC conduit is considered by most to be one of the lightest and most easy to use types of electrical conduit that we use. Also, PVC conduit is typically found at a lower cost than some of the other options. You can find in several different wall thicknesses depending on your applications. It is very common to see PVC conduit used underground and embedded within concrete because of its non-corrosive characteristics. There are many different sizes and fittings that can be used, which makes it very versatile for many different applications. It is not intended for areas that will be exposed to direct sunlight, as this can degrade the material over time. For the most part, PVC is a great option for the majority of underground scenarios, and is commonly used in industrial, commercial and residential environments.
