According to our (LP Info Research) latest study, the global PVC Latex market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the PVC Latex is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global PVC Latex market. With recovery from influence of COVID-19 and the Russia-Ukraine War, PVC Latex are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of PVC Latex. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the PVC Latex market.

The production process of PVC latex includes two stages. The first stage is that vinyl chloride monomer undergoes emulsion polymerization to generate polyvinyl chloride latex, which is a suspoemulsion of polyvinyl chloride primary particles with a diameter of 0.1 to 3 microns in water. The second stage is to make polyvinyl chloride paste resin through dehydration, drying, screening and other processes of polyvinyl chloride latex. In addition, there is another production method called suspension polymerization. The general process of this method is to add water, suspending agent, and antioxidant to the cleaned polymerization kettle, then add vinyl chloride monomer, stir in deionized water, and disperse the monomer into small droplets. The drops are stabilized by protective glue, and monomer-soluble initiators or initiator emulsions are added to keep the reaction speed stable during the reaction process, and then the temperature is

raised to polymerize. Generally, the polymerization temperature is between 45 and 70 °C
