Abstracts

According to this study, the global PVC Pipe Extrusion Line market size will reach US\$ 1041 million by 2031.

A PVC (Polyvinyl Chloride) pipe extrusion line is a specialized manufacturing system designed to produce PVC pipes through the extrusion process. PVC pipes are widely used in various industries for water supply, drainage, construction, agriculture, and industrial applications due to their durability, chemical resistance, and cost-effectiveness.

A typical extrusion line consists of several key modules that work in sequence to transform PVC resin into finished pipes. The main components include:

(1) Feeding System

- Hopper & Dryer: Stores and dries PVC resin pellets to remove moisture, preventing defects like bubbles during extrusion.

- Feeder: Controls the precise flow of resin into the extruder, often combined with additives (e.g., stabilizers, lubricants, colorants) for specific pipe properties.

(2) Extruder

- Screw & Barrel: The heart of the system, where PVC resin is heated (160–200°C) and melted by the rotating screw. The screw design (e.g., single-screw vs. twin-screw) affects mixing efficiency and output rate.

- Single-screw extruders: Suitable for standard pipes, offering lower cost and simpler maintenance.

- Twin-screw extruders: Ideal for complex formulations or high-output needs, providing better plasticization and mixing.

#????

(3) Molding System (Die Head)

- Pipe Die: Shapes the melted PVC into a tubular form. The die consists of a core and a sleeve, with the gap between them determining the pipe's outer diameter (OD) and wall thickness.

- Calibration Device: Cooled molds (calibrators) surrounding the die set the pipe's dimensions and surface finish. Water or air cooling is used to solidify the pipe quickly.

(4) Cooling System

- Water Trough or Spray Chamber: Further cools the pipe to stabilize its structure, preventing deformation. Temperature and flow rate are precisely controlled for uniform cooling.

(5)???? (Pulling System)

- Traction Units: Rubber rollers or belts that pull the cooled pipe through the line at a constant speed, ensuring consistent wall thickness and length. The speed must match the extrusion rate to avoid stretching or sagging.

(6) Cutting & Coiling System

- **Cutter**: Automatically cuts the pipe to specified lengths (e.g., 6 m, 12 m) using saws or blades. For flexible pipes, a coiling mechanism may be used instead.

#????

(7) Control System

- PLC (Programmable Logic Controller) & HMI (Human-Machine Interface): Monitors and controls all processes, including temperature, speed, and material flow, ensuring production stability and quality.
