The global Pyroligneous Acid market size is predicted to grow from US\$ 61043 million in 2025 to US\$ 73061 million in 2032; it is expected to grow at a CAGR of 2.6% from 2026 to 2032.

Pyroligneous Acid, also known as wood vinegar, is a brown acidic condensate obtained during the pyrolysis or carbonization of wood, bamboo, and other biomass. After settling, filtration, and in some cases distillation, it is used mainly as an agricultural input, deodorizing and antimicrobial aid, composting additive, and biomass-derived specialty liquid in horticulture, livestock, and selected consumer products. In 2025, Global Pyroligneous Acid sales is estimated at 240 kilotons, with an average ex-works price of US\$260/ton and global capacity of 340 kilotons per year, with a gross margin range of 18%?32%.

The primary driver of the pyroligneous acid market is the rising demand for biomass-derived, low-residue, multifunctional inputs in agriculture and environmental management. Wood vinegar has gained attention because it can serve several roles at once?soil conditioning, microbial regulation, odor reduction, compost enhancement, and natural pest-repellent support?while fitting the broader trend toward circular biomass utilization, especially where charcoal, biochar, or pyrolysis systems already exist and can monetize the condensate stream instead of discarding it. Demand is also supported by its use in livestock odor control and selected consumer products, which broadens the addressable market beyond crop farming alone.
