Pyrolysis gasoline, also known as pygas, is a byproduct of various thermal cracking processes used in the petroleum refining industry to convert heavier hydrocarbons into lighter ones, such as naphtha, gasoline, and olefins. Pyrolysis gasoline contains a mixture of hydrocarbons, including unsaturated compounds like olefins and diolefins, as well as aromatic compounds.

Hydrogenation of pyrolysis gasoline is a process aimed at saturating these unsaturated compounds to improve the quality of the gasoline and increase its stability, octane rating, and suitability for downstream processing. This hydrogenation process typically involves the use of catalysts to facilitate the reaction under milder conditions.

The global Pyrolysis Gasoline Hydrogenation Catalysts market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
