Pyromellitic Dianhydride (PMDA) is an important aromatic tetracarboxylic dianhydride widely used as a key raw material in the production of high-performance polyimide resins. Known for its rigid molecular structure and excellent thermal stability, PMDA is commonly employed in the electronics, aerospace, automotive, and chemical industries. It serves as a critical component in the synthesis of polyimide films, fibers, adhesives, and coatings, which require resistance to high temperatures, chemicals, and mechanical stress. Additionally, PMDA is also used in the manufacture of epoxy curing agents, plasticizers, and engineering plastics, making it a versatile and valuable chemical intermediate in advanced material applications.

Pyromellitic Dianhydride is mainly used in the production of polyimide. Polyimide is a high-temperature-resistant high-grade insulating materials, widely used in aerospace and electronics industry. With the rapid development of the electronics industry, the annual demand for polyimide will maintain a high growth rate. China is the main producer of homophthalic dianhydride, with the future rapid development of the electronic semiconductor industry, homophthalic dianhydride has a broad market development prospects.

Asia Pacific is the largest and fastest growing market, led by China, South Korea and Japan. China dominates both the production and consumption of Pyromellitic Dianhydride, with demand coming from electronics manufacturing, polyimide film production, and domestic innovation in flexible electronics and electric vehicles.
