The global Pyrotinib Maleate market size is predicted to grow from US\$ 216 million in 2025 to US\$ 488 million in 2032; it is expected to grow at a CAGR of 10.4% from 2026 to 2032.

In 2025, global Pyrotinib Maleate production reached approximately 420,000 units. Pyrotinib maleate is an oral small-molecule targeted anticancer drug and an irreversible inhibitor of the human epidermal growth factor receptor (HER) family. It exerts its antitumor effects primarily by simultaneously inhibiting HER1, HER2, and HER4 signaling pathways. Clinically, it is mainly used for the treatment of HER2-positive breast cancer, particularly in patients who have previously received anti-HER2 therapies such as trastuzumab. Pyrotinib maleate blocks tumor cell proliferation signaling pathways, thereby inhibiting tumor growth and delaying disease progression. It is commonly used in combination with other chemotherapeutic agents to enhance therapeutic efficacy and improve patient outcomes. With the advancement of precision medicine and the growing adoption of targeted therapy concepts, the clinical value of pyrotinib maleate in oncology continues to increase.

Pyrotinib Maleate is an irreversible pan-HER tyrosine kinase inhibitor primarily used for the treatment of HER2-positive breast cancer, demonstrating strong competitiveness in China's oncology targeted therapy market. With the increasing rate of early breast cancer screening and the widespread adoption of HER2 testing, the demand for precision medicine continues to grow, providing a solid clinical foundation for this drug.

From a market landscape perspective, anti-HER2 monoclonal antibodies such as Trastuzumab and Pertuzumab, as well as antibody-drug conjugates (ADCs) like T-DM1, occupy important positions. However, as an oral small-molecule TKI, pyrotinib maleate shows favorable efficacy and convenience, particularly in patients with advanced disease or those who have failed prior therapies. In addition, its inclusion in the national

reimbursement drug list helps improve patient accessibility and expand market penetration.

On the policy side, volume-based procurement and healthcare cost-control measures exert downward pressure on drug pricing while also driving increased market uptake. From a competitive standpoint, the continuous emergence of similar HER2-targeted therapies from both domestic and international players is intensifying market competition. Therefore, the future market performance of pyrotinib maleate will depend on its progress in combination therapies, expansion of indications (such as HER2-mutant lung cancer), and accumulation of real-world evidence, as well as its overall balance of efficacy, safety, and pricing competitiveness.
