Pyruvate kinase is an enzyme involved in glycolysis, the metabolic pathway that breaks down glucose to produce energy in the form of ATP. Specifically, pyruvate kinase catalyzes the transfer of a phosphate group from phosphoenolpyruvate (PEP) to adenosine diphosphate (ADP), forming pyruvate and ATP. This reaction is the final step in glycolysis and is essential for generating ATP, the energy currency of the cell. Pyruvate kinase exists in multiple isoforms, with each isoform exhibiting tissue-specific expression patterns and regulatory properties, playing crucial roles in energy metabolism and cellular function.
