Quartz glass crucible is a container made of fused silica glass, which is used for high-temperature chemical reaction and material processing. It is typically used in the semiconductor industry to grow single crystals of silicon, gallium arsenide, and other materials. Quartz glass crucibles have high thermal shock resistance and can withstand temperatures up to 1000 ° C or higher without cracking or fracture. They also have strong resistance to chemical attack and can be used for various acids, alkalis, and

other corrosive materials. Quartz glass crucibles are not only used in the semiconductor industry, but also in the production of high-purity metals and alloys, as well as in the manufacturing of optical fibers, lenses, and other components. Overall, quartz glass crucibles are a versatile and reliable tool for high-temperature chemical reactions and material processing, especially in applications where purity and chemical resistance are crucial.
