Quartz is a commonly used material in the semiconductor industry due to its high purity

and chemical resistance. Quartz rings and electrodes are commonly used in plasma etching processes, where high-energy plasma is used to etch patterns onto the substrate. The quartz ring is used to keep the substrate in place during the etching process and provide a barrier between the plasma and the substrate. They are usually made of high-purity quartz and are designed to withstand the high temperatures and corrosive gases used during the etching process. On the other hand, quartz electrodes are used to generate plasma for etching substrates. They are usually made of conductive materials such as tungsten and coated with a layer of high-purity quartz to protect them from the corrosive gases used during the etching process. Overall, quartz rings and electrodes are important components of plasma etching processes as they help ensure accurate and effective etching of the substrate.
