## Abstracts

The global Rabbit Primary Cell market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Rabbit primary cells refer to cells isolated directly from rabbits, which maintain their natural characteristics and functions. Similar to mouse primary cells, rabbit primary cells provide a more physiologically relevant model for studying various biological processes compared to immortalized cell lines. These cells can be obtained from different tissues, including liver, kidney, heart, lung, and immune system, and are commonly used in research related to cardiovascular diseases, immunology, toxicology, and drug discovery. Rabbit primary cells offer researchers the opportunity to investigate disease mechanisms, evaluate drug efficacy, and gain insights into molecular pathways in a more accurate experimental model.

The industry trend for rabbit primary cells has been witnessing an upward growth due to their unique advantages and applications in various research areas. As the demand for more reliable and predictive in vitro models increases, using primary cells from rabbits is gaining prominence. Rabbit primary cells possess characteristics close to human cells, making them suitable for conducting pre-clinical studies and modeling human diseases. The pharmaceutical and biotechnology industries are particularly interested in these cells for drug screening, target validation, and safety assessment purposes. Consequently, there is a growing interest in developing standardized protocols, expanding the range of available rabbit primary cells, and enhancing associated support services to meet the rising demand.
