A rack-mounted optical amplifier is a gain device used in fiber-optic communication systems, usually designed as a standardized module that can be installed in a rack or cabinet. It enhances the strength of optical signals to compensate for the attenuation of signals during long-distance transmission. Rack-mounted optical amplifiers are widely used in telecommunications, data centers, long-distance transmission, and fiber-optic networks. They can provide efficient and stable optical signal gain to ensure high-bandwidth and low-latency data transmission. Its structure usually includes multiple gain modules, control circuits, and heat dissipation systems to support high-capacity, multi-channel optical signal processing.
