The global Radar Altimeter Test Sets market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Radio Altimeter Test Set is a flight line test set instrument used to test radio altimeters through linear altitude simulation. Radio altimeters are used to measure the distance between the ground terrain and the aircraft. It is also known as a radar altimeter, and the instrument will analyze the frequency drift and timing of reflected radio waves to provide critical flight navigation data. Today, radio altimeters are the primary altimeters used on aircraft and are mainly divided into pulse altimeters and FMCW altimeters. Pulse radio altimeters send and receive radio pulse signals, interpreting the round-trip time as a function of distance, just like a pulse radar operation. In the FMCW method, the frequency deviation of the transmitted and received signals is used to determine the altitude of the aircraft.
