The global Radar Cross Section (RCS) Measurement System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A Radar Cross Section (RCS) measurement system is used to determine how detectable an object is by radar, based on the amount of radar signal it reflects back to the source. This system typically involves emitting electromagnetic waves towards the object and measuring the scattered energy from different angles to evaluate its radar signature. RCS is critical for assessing the stealth characteristics of military aircraft, ships, and vehicles, as well as for designing radar systems and improving the performance of commercial radar applications. RCS measurement systems are essential in defense and aerospace industries, where minimizing an object's radar visibility is key to enhancing its survivability in hostile environments.

United States market for Radar Cross Section (RCS) Measurement System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
