The global Radar Tachometer market size is predicted to grow from US$ 89.73 million in 2025 to US$ 137 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

In 2024, global Radar Tachometer production reached approximately 24.7 k units , with an average global market price of around US$ 3500per unit. Radar Tachometer is a device that uses the Doppler effect of electromagnetic waves to measure the flow velocity of water. It emits radar beams onto the surface of the water and receives the reflected echoes, then analyzes the Doppler shift of these echoes to calculate the water flow velocity. This technology enables non-contact measurement, avoiding the interference that traditional measurement methods may cause, and is suitable for various aquatic environments such as rivers, lakes, and oceans.

Radar Tachometer, with advantages of non-contact measurement, high precision, and strong environmental adaptability, are gaining traction in smart water management and extreme weather monitoring, gradually replacing traditional contact-based devices in rivers and urban drainage. Future growth will hinge on IoT integration and multi-parameter capabilities, though challenges remain in cost competition and data reliability under complex weather conditions.
