The radial artery hemostat is a device specifically used to effectively stop bleeding in the radial artery after medical procedures. It is mainly used in interventional treatments such as transradial cardiac catheterization. It is usually made of soft materials such as medical-grade silicone or polyurethane, including an adjustable pressure airbag or foam pad, a fixing belt and an adjustment device. The hemostat quickly stops bleeding by applying pressure above the radial artery puncture point. At the same time, the transparent design makes it easy for medical staff to observe the puncture point in real time and adjust the pressure at any time.
