Radial Spherical Plain Bearings is a special structure of sliding bearing. Its structure is simpler than that of rolling bearings. It mainly consists of an inner ring with an outer spherical surface and an outer ring with an inner spherical surface, which can withstand larger loads. Depending on its type and structure, it can withstand radial loads, axial loads, or combined loads of both radial and axial directions. It is generally used for low-speed swinging motion (i.e. angular motion). Due to the spherical sliding surface, it can also perform tilting motion (i.e. centering motion) within a certain angle range. It can still work normally when the support shaft and the shaft shell hole are not concentric. Radial Spherical Plain Bearings Requiring Maintenance are mainly composed of an inner ring with an outer spherical surface and an outer ring with an inner spherical surface. Its structure is relatively simple, but it has a large load capacity and impact resistance. In addition, oil lubricated radial joint bearings are usually equipped with lubrication grooves and oil holes to facilitate the supply and distribution of lubricants, thereby extending the service life of the bearings and improving work efficiency.

United States market for Radial Spherical Plain Bearings Requiring Maintenance is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Radial Spherical Plain Bearings Requiring Maintenance is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
