The global Radiant Quartz Heaters market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Radiant Quartz Heaters are electric heating devices that use quartz heating elements to produce radiant heat. These heaters work by emitting infrared radiation, which directly warms people and objects in its path rather than heating the surrounding air. The quartz heating element, typically made from a quartz tube or rod, contains a filament that heats up when an electric current passes through it. The quartz material helps to focus and amplify the infrared heat, making these heaters highly efficient for localized or spot heating.
