In physics, radiation is the emission or transmission of energy in the form of waves or particles through space or through a material medium. The pulse is then detected and displayed by the instrument. Gas filled detector: This instrument works on the principle that as radiation passes through air or a specific gas, ionization of the molecules in the air occur. The more radiation which enters the chamber, the more current is displayed by the instrument.

The increased use of radioactive materials in areas, such as power production, industrial processing, medical research and processing, and the security sector,

intensified the need for equipment offering protection against radioactive radiations. The increased stability of manufacturing industries is likely to augment the growth of the market during the forecast period. Usage of radiography testing in the manufacturing industry to test the quality of manufactured goods and to inspect flaws is also, likely to fuel the growth of the market.
