Radiation-Resistant Semiconductor Material is a kind of material that can withstand high levels of ionizing radiation without losing its functionality or performance. Ionizing radiation can damage the structure and properties of conventional semiconductor materials, such as silicon, by creating defects, charge traps, and interface states. Radiation-Resistant Semiconductor Materials have stronger atomic bonds, higher band gaps, and lower defect densities that make them more resilient to radiation effects.

The global Radiation-Resistant Semiconductor Material market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
