Abstracts

The global Radiation Suits market size is predicted to grow from US\$ 755 million in 2025 to US\$ 1049 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Radiation suits refers to professional protective equipment used to reduce the risk of personnel exposure to ionizing radiation, mainly by shielding, absorbing, and blocking radiation energy, reducing the impact of X-rays, gamma rays, neutron radiation, and radioactive pollutants on the human body. This type of product is usually made of high-density shielding materials such as lead, tungsten, bismuth, as well as lead-free composite materials, multi-layer barrier films, and high-performance fibers. It is widely used in fields such as hospital radiology, interventional surgery, nuclear power plants, industrial testing, scientific research experiments, military and emergency rescue.

In 2025, global Radiation Suits production reached approximately 569 K Units, with an average global market price of around US\$ 1,356 per unit.

The radiation suits market benefits from the popularization of medical imaging equipment, the development of the nuclear energy industry, and the continuous improvement of global radiation safety regulations, maintaining a stable growth trend. Among them, X-ray protective clothing in the medical field occupies the main market share and is the best-selling product type; Although the market size of nuclear industry protective clothing and CBRN comprehensive protective clothing is relatively small, they have higher added value due to their high technical requirements and strong certification barriers. The future development direction of the industry will focus on lightweight, lead-free, multifunctional composite materials, and comfort improvement. Tungsten/bismuth based environmentally friendly shielding materials, multi-layer composite protective structures, and intelligent protective design will become important

directions for market competition.
