Radiator Traps are devices used in steam heating systems to automatically discharge condensate (water) and air from steam radiators while preventing the loss of live steam. They ensure efficient and consistent heating by maintaining the proper flow and utilization of steam within the system. Radiator traps operate through various mechanisms, such as thermostatic, float and thermostatic, thermodynamic, and inverted bucket designs, each suited to specific applications and conditions. These traps are crucial for enhancing energy efficiency, providing uniform heating, and reducing maintenance needs in residential, commercial, industrial, and institutional buildings.
