From the earliest days of the feature phone market where devices were used mostly for talk and text to the smartphones capable of download speeds faster than many home Internet connections, there has been one constant, an underappreciation for the radio frequency (RF) front-end. Most smartphone users today aren't even aware of what the RF front-end is, but it has remained one of the most critical aspects of mobile handset design since the product's inception. The RF front-end (RFFE) is the functional area of a mobile handset between the RF transceiver and the antenna, comprised mostly of components like power amplifiers (PAs), low noise amplifiers (LNAs), switches, duplexers, filters, and other passive devices. Without an adequate RFFE, a device simply wouldn't be able to connect to mobile networks and would be essentially useless to today's mobile users. A properly designed RFFE is critical to the recent innovation occurring in regards to a phone's performance, features, and industrial design.
