Radioactive microspheres, also known as radioactive beads or radioembolization microspheres, are tiny spheres typically made of a biocompatible material (such as glass or resin) containing a radioactive substance, often yttrium-90 (⁹⁰Y) or iodine-131 (¹³¹I). These microspheres are used in a medical procedure called radioembolization or selective internal radiation therapy (SIRT).

Radioactive microspheres are employed in the treatment of certain types of liver cancer, particularly hepatocellular carcinoma (HCC) and metastatic liver tumors. They work by delivering a high dose of radiation directly to the tumor site while sparing healthy surrounding tissue. This localized radiation therapy helps to destroy cancer cells and shrink tumors.

The global Radioactive Microspheres market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
