## Abstracts

The global Radioactivity Testing of Building Materials market size is predicted to grow from US$ 1091 million in 2025 to US$ 1588 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

Radioactivity testing for building materials refers to the process of measuring and evaluating the content of natural radionuclides (primarily uranium-238, thorium-232, and potassium-40) in building materials such as stone, concrete, bricks, and gypsum boards using professional instruments (such as gamma spectrometers and radon detectors). The purpose is to determine whether the materials release excessive amounts of radioactive radon gas or gamma radiation to ensure that they do not pose a hazard to human health during use in buildings and to ensure a safe indoor environment. Test results are usually based on national standards.
