Radiochemistry is a branch of chemistry that deals with radioactive substances and phenomena. It involves the use of radioactive isotopes of elements to study the properties and chemical reactions of non-radioactive isotopes. Radiochemical methods of analysis take advantage of the instability of some elemental isotopes, which decay through the release of alpha particles, beta particles, gamma rays, and/or X-rays, often providing for a selective analysis for one analyte in a complex mixture of other species without the need for a prior separation. Radiochemistry is widely used in medical applications, including nuclear medicine and the treatment of cancer.
