The global Radiofrequency Electrosurgical Device market size is predicted to grow from US\$ 1070 million in 2025 to US\$ 1716 million in 2031; it is expected to grow at a CAGR of 8.2% from 2025 to 2031.

Electrosurgery is the use of high energy alternating current to increase intracellular temperature in order to achieve vaporization or combination of desiccation and protein coagulation of biological tissue. Electrosurgical devices are used to perform coagulation, fulguration, desiccation, tissue ablation, and cutting procedures. This is carried out by conversion of electromagnetic energy into kinetic energy inside the tissue of biological cell, which is further converted into thermal energy providing desired effect. Electrosurgical devices are used in general surgery, cardiology, urology, gynecology, cosmetology, and dermatology. Radiofrequency devices are used in surgical procedures which use high frequency current, viz. frequency above 1000 kHz that transmits radio signal to perform tissue desiccation and protein coagulation.

According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing

awareness about early disease diagnosis and treatment.
