A radiographic intensifying screen is a device used in X-ray imaging systems to enhance the brightness or intensity of X-ray images. Typically made from fluorescent materials such as tungsten, tellurium, or barium sulfate, these screens convert X-rays passing through them into visible light, thereby reducing the X-ray dose required for image capture and improving the quality of the image. Radiographic intensifying screens are commonly used in medical radiology, industrial non-destructive testing, and other fields to enhance image clarity and reduce radiation exposure to patients or samples.
