A Radiography Flat Panel Detector is a digital imaging device used in radiography and medical imaging to capture X-ray images directly onto a flat panel sensor. It replaces traditional X-ray film and improves efficiency, image quality, and workflow in diagnostic imaging. The detector consists of a scintillator layer that converts X-rays into light, which is then converted into electrical signals by an array of photodiodes or thin-film transistors. This technology provides real-time imaging, immediate image availability, dose reduction benefits, and the ability to enhance and manipulate images digitally, revolutionizing the field of radiography.

The global Radiography Flat Panel Detector market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
