The global Radiopharmaceutical Freeze-Dried Products market size is predicted to grow from US$ 374 million in 2025 to US$ 525 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Radiopharmaceutical freeze-dried products are solid dosage forms of radioactive drugs created through lyophilization (freeze-drying). This process involves freezing the drug and then removing its water content in a vacuum, resulting in a stable powder or pellet that can be stored for extended periods. When needed for diagnostic or therapeutic use, the product is reconstituted by adding a specific solvent, which returns it to a liquid state. This method is particularly crucial in nuclear medicine due to the short half-life of many radiopharmaceuticals, making it a reliable solution for their transportation and storage.

United States market for Radiopharmaceutical Freeze-Dried Products is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
