The global Radiopharmaceutical Transport Service market size is predicted to grow from US\$ 1553 million in 2025 to US\$ 2229 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Radiopharmaceutical transport service refers to the entire logistics process of safely and compliantly transporting radiopharmaceuticals containing radioisotopes used in nuclear medicine diagnosis or treatment from production sites to medical institutions, diagnostic centers, or patient usage locations. This transport process has extremely high requirements for time sensitivity, radiation protection, safety shielding, packaging compliance, and temperature control. It must strictly comply with the relevant regulations of the International Atomic Energy Agency (IAEA) and national nuclear safety regulatory authorities to ensure that radiation leakage is prevented during transport, personnel exposure is avoided, and the activity and efficacy of the drugs are guaranteed.

With the rapid development of nuclear medicine in tumor diagnosis and targeted therapy, the demand for radiopharmaceuticals continues to grow, driving the transport market towards specialization, refinement, and high safety standards. In the future, the expanded application of short-half-life isotopes will further strengthen the 'just-in-time delivery + regionalized production + distributed supply chain' model, placing higher demands on the timeliness and reliability of the transport network. At the same time, automated shielded transport containers, intelligent tracking systems, unmanned transport, and integrated cold chain and radiation monitoring technologies will be rapidly adopted. Overall, the sector will maintain high growth as the precision medicine and radiopharmaceutical industries expand, but it will also continue to be constrained by strict regulation and high barriers to entry.
