Radiosurgery uses a special focused beam of ionizing radiation directed at the patient. It is mainly used to treat tumors. High doses of radiation are delivered to tumors by directing beams of light across them in different directions. Before the introduction of real-time tissue tracking, radiosurgery was limited to brain treatment using a stereotaxic frame. However, due to the introduction of real-time tissue tracking systems in currently commercially available non-invasive radiosurgery robotic systems, the scope of reflex surgery treatments has increased significantly.

The global Radiosurgery Noninvasive Robots market size is projected to grow from US\$ 2123 million in 2024 to US\$ 4822 million in 2030; it is expected to grow at a CAGR of 14.6% from 2024 to 2030.
