Railway Grease is a semisolid lubricant used in in the rail transport sector, which can reduce the friction at the rail-wheel interface, extend rail and wheel life, reduce fuel consumption and reduce wheel squeeze. Grease generally consists of a soap emulsified with mineral or vegetable oil. The characteristic feature of greases is that they possess a high initial viscosity, which upon the application of shear, drops to give the effect of an oil-lubricated bearing of approximately the same viscosity as the base oil used in the grease.
