The global Rail Transit Energy Feedback Device market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Rail transit energy feedback device products are products used in the power supply systems of subways, light rails and other trains. When the train is in the power generation state during electric braking, it will cause the DC voltage to rise, posing an overvoltage threat to the electrical equipment and power supply system in the DC power supply system. The main function of the energy feedback device is to absorb or store this part of the regenerated energy to achieve the effect of energy saving, while avoiding overvoltage in the DC power supply system, ensuring the normal use of the power supply system, and ensuring the safe operation of the rail transit system.
