A railway brake shoe is a crucial component of a train's braking system, designed to slow down or stop the train by creating friction against the wheel tread. Typically made from composite materials, cast iron, or other high-friction compounds, brake shoes press directly onto the wheels when the brakes are applied, converting kinetic energy into heat. They are used mainly in older or freight rail systems, while modern passenger trains often use disc brakes. Brake shoes must be durable and heat-resistant, and they require regular inspection and replacement to ensure safe and effective train operation.
