A RAM-type steering gear is a mechanical system used in marine vessels to convert the rotational motion from a steering mechanism—such as a steering wheel or hydraulic pump—into linear motion for controlling the rudder. It operates on the principle of a piston (ram) moving within a cylinder, where hydraulic pressure or mechanical force drives the ram to push or pull a tiller arm connected to the rudder stock. This linear action translates to the rudder's angular movement, enabling course adjustment. Typically composed of a cylinder, piston, connecting rods, and a tiller, the RAM-type design is valued for its durability, high torque output, and ability to handle heavy loads, making it suitable for large ships and commercial vessels that require reliable steering under varying sea conditions. Its robust construction and straightforward mechanics also facilitate maintenance and repair, contributing to its widespread use in maritime applications.
