According to this study, the global Raman Spectroscopy Technology market size will reach US\$ 156 million by 2031.

Raman Spectroscopy Technology is a spectroscopic technique used to study the vibration modes, rotation modes, and other alternative modes of a system in a lattice.

Raman scattering is an inelastic scattering, and the laser range usually used for excitation is visible light, near-infrared light or near the near-ultraviolet light range. The laser interacts with the system phonons, resulting in an increase or decrease in the final photon energy, and changes in these energies can identify phonon patterns. This is similar to the basic principle of infrared light absorption spectrum, but in addition, the data obtained are complementary.
