The global Rapid Exchange Balloon Catheter market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The rapid exchange balloon catheter is a uniquely designed balloon dilatation catheter, the main feature of which is its exchange mechanism. The catheter is provided with a side hole at a certain distance (usually 25 cm) from the top of the balloon, and the guide wire can be inserted from the top of the balloon and pass through the side hole. This design allows the doctor to easily replace the balloon dilatation catheter without withdrawing the entire balloon system during the operation, without the need to use an extended guide wire.

During the operation, the doctor first delivers the catheter and balloon to the lesion through the guide wire. Then, the balloon is inflated and expanded through the catheter seat and connected to the inflation device to expand the blood vessel or other lumen. When the balloon dilatation catheter needs to be replaced, the doctor can keep the guide wire in place through the side hole without withdrawing the entire balloon system, and replace the new balloon dilatation catheter at the same time.

Rapid exchange balloon catheters are widely used in the field of vascular interventional treatment, such as coronary artery interventional treatment, peripheral vascular interventional treatment, etc. In addition, it can also be used in many fields such as neurointerventional treatment, biliary interventional treatment, and digestive tract interventional treatment.
