Rapid Palatal Expander is an orthodontic tool. Upper jaw expansion is a form of orthodontic treatment that is used in specific cases. By widening the circumference of the palate, the perimeter of the dental arch increases to create more space for teeth growth.

Rapid palate expanders are mainly used to treat maxillofacial deformities such as maxillary stenosis or cross bite. It enlarges the width of the maxilla by gradually separating the palatine portion of the maxilla by applying gentle force. The process is gradual, usually with daily adjustments until the desired maxillary width is achieved. The rapid palatal dilator applies expansion force primarily through the midline suture of the palatine bone, which is a critical site for palatal bone separation. The dilator usually has a screw or an adjustable device that can be adjusted by a medical professional or orthodontist to the needs of each patient.
