Raw water filtration glass beads are specialized filter media made from high-purity or recycled glass, formed into smooth, spherical particles designed to remove suspended solids and impurities from untreated or minimally treated water sources such as rivers, lakes, wells, and industrial intakes. Unlike traditional sand or gravel, these non-porous, uniformly sized glass beads provide higher filtration efficiency, while resisting biofilm formation and reducing clogging. Their durability, chemical inertness, and reduced backwash requirements make them ideal for use in municipal water treatment, industrial pre-filtration, irrigation systems, and environmental remediation, offering a sustainable and effective solution for improving water quality in the early stages of treatment.
