RDF Pelletizer, also called garbage-derived fuel pelletizer, is a piece of equipment used to process garbage-derived fuel. RDF Pelletizer usually consists of feeding system, compression system, granulation system and discharge system. During the operation, the refuse-derived fuel is first fed into the pelletizer. After a series of processes, including compression, granulation, cooling and other steps, uniform pelletized fuel is finally produced. These pellet fuels have high calorific value and better combustion characteristics, which can effectively replace traditional fossil fuels, while also helping to reduce the negative impact of landfills on the environment.

The global RDF Pelletizer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
